INVESTMENT STRATEGY

- Employs a relative strength approach to capture growth opportunities in up markets while offering protection in down markets.
- Exposure to a wide range of asset classes that include Canadian, U.S. and international equities, individual equity sectors, fixed income, cash, commodities and currencies.
- Sophisticated daily analysis is used to drive the decision to rotate into or out of asset classes and their individual holdings, when warranted, in an effort to achieve stronger returns and capital protection.

After delivering a modest recovery from the lows of early March, equity markets experienced a resurgence in volatility and most of the major indices we follow saw material losses in April. The minutes from the Federal Reserve's March meeting indicated a more aggressive-than-expected stance towards the approach to monetary tightening and hinted at a 50-basis point hike in May, triggering a risk-off sentiment. Putin's pessimism towards ongoing negotiations with Ukraine and rigid lockdown measures in China exacerbated supply chain issues and only worked to pressure capital markets. For the second half of April, Q1 earnings results were in focus as investors assessed how companies fared against rising inflationary pressures. After mixed earnings results from mega-cap FAANG names, stocks slid to end April, with the Nasdaq sliding 13% to mark its worst month since October 2008.

*The BMO SIA Focused North American Equity Fund utilizes SIA Wealth Management's relative-strength methodology and will target fifteen individual North American securities while equities are in favor; however, the fund could hold as little as zero equity positions when equities are unfavored. SIA Wealth Management, who acts as sub advisor for the Diversiflex portfolios also acts as sub advisor for the BMO SIA Focused North American Equity Fund.

**Calculated using change in month end values for the trailing 3 and 5 year periods (annualized for 12 months per year).

Performance is calculated using month-end market values of the model portfolio. Since we use a model portfolio to calculate performance, there are no client-initiated cash flows (deposits/withdrawals) to account for. Performance is calculated by dividing the change in the model portfolio's market value by the model portfolio's market value at the beginning of the performance period. Also, any and all income generated by the portfolio's holdings are held within the model portfolio in cash and is accounted for in the portfolio's month-end market value – this results in a total return measure of the model's performance. Returns for periods less than 1 year are shown as periodic returns while returns for periods greater than 1 year are annualized.
